

Peak Sandwich Collection Weeks

Corrected findings from the production collection log

Reviewed September 28, 2026 | Completed weeks through September 22, 2026

The corrected headline

The largest completed Wednesday-Tuesday week in the current collection records was January 15-21, 2025: 28,927 sandwiches. The supplied draft's 38,828 figure for November 2023 comes from a separate historical weekly-import table, not the current collection-log total.

Five highest completed weeks

Wednesday-Tuesday	Total	Individual	Group
Jan 15-21, 2025	28,927	7,361	21,566
Nov 15-21, 2023	27,810	8,136	19,674
Jan 11-17, 2023	27,132	5,134	21,998
Jan 14-20, 2026	24,717	4,570	20,147
Sep 25-Oct 1, 2024	24,664	6,617	18,047

Group and individual are recorded categories; both are included in each total.

Annual totals from current records

Year	Logged sandwiches
2020*	44,958
2021	281,395
2022	440,371
2023	473,409
2024	501,856
2025	526,083

*2020 starts April 22. 2026 is incomplete.

What the current data supports

- 2025 was a complete calendar year in this dataset and logged 526,083 sandwiches, 24,227 more than 2024 (+4.8%). The draft's claim of a 2025 decrease is not supported here.
- The largest complete month through 2025 was November 2022 (60,082). November 2023 was 54,849 in the collection log, not 65,547.
- "Groups" is a collection-log category, not a physical location. Group counts should not be interpreted as a single regional host's production.

Corrections to the supplied draft

November 2023 record

The draft calls November 15, 2023 a 38,828-sandwich record and attributes 19,414 to a special event. The current collection log totals 27,810 that week (8,136 individual + 19,674 group). It includes a 19,414 entry under "Groups"; the log does not establish that it was one special event.

Conflicting historical source

The separate authoritative `_weekly_collections` import has 38,828 for November 15, 2023, including an additional 11,278 legacy group bucket. That bucket is not a separate entry in the current collection log. Do not add the two tables together or mix their weekly rankings.

September 2024 week

September 25-October 1, 2024 totals 24,664 in current collection records, not the draft's 24,534. It is fifth, not the all-time record, in this source.

Events, seasonality and value

The log alone cannot establish hurricane response, holiday strategy, volunteer retention, demand, organization-wide surge capacity, or dollar value. The draft's claims about these were removed instead of restated as facts.

How these numbers were calculated

- Source: production `sandwich_collections` table; non-deleted records with `collection_date` from April 22, 2020 through September 22, 2026. The ongoing September 23-29 week is excluded from peak-week rankings.
- Week boundaries are Wednesday through Tuesday, assigned by `collection_date` (when the sandwiches were collected), not the date the entry was submitted.
- Each record contributes `individual_sandwiches` plus group counts from `group_collections`. If the JSON group list is empty, use legacy `group1_count` and `group2_count` instead; never add both representations. String-encoded JSON group lists are parsed before summing. Soft-deleted entries are excluded.
- Calendar-year and monthly sums use `collection_date`, not the week-start date. 2020 begins with the first recorded April collection; 2026 is incomplete and is not used in full-year comparisons.
- These are totals as recorded, not an independent audit of deliveries. Some categorization issues may still need correction by the team. The separate historical-import table gives different totals and is not silently substituted for collection records in this report.

Data source: production database, read-only review on September 28, 2026. No collection records were edited to prepare this report.
